17. a pixel electrode and a common electrode on the first substrate, the pixel and common electrodes being formed of a transparent conductive material; and
a liquid crystal layer between the first and second substrates, wherein the common electrode is alternating with and being parallel to the pixel electrode.

By
17. An in-plane switching Liquid Crystal Display (LCD) device, comprising:
a first substrate and a second substrate;
a gate line on the first substrate;
a metal common line on the first substrate, the common line parallel with the gate line.
a data line on the first substrate, the data line being perpendicular to the gate line;
a common electrode on the first substrate;
a thin film transistor having a gate electrode, a source electrode and a drain electrode formed on the first substrate;
liquid crystal interposed between the first and second substrates;
a pixel electrode contacting the drain electrode of the thin film transistor; and
wherein, the pixel and common electrodes are formed of a transparent conductive material and the common electrode is alternating with and being parallel to the pixel electrode.
